

CLOSURE DEVICE AND CONTAINER EQUIPPED THEREWITH

Abstract

5 The invention concerns a device designed to close a container (3) provided with a neck (2). Said device comprises: a first portion designed to form a closure element (4); a second annular portion (5), designed to be maintained around the neck (2); and a third portion forming a tamper-evident tab (6) linking the first (4) to the second portion (5), which is connected to said first and second
10 portions (4, 5) by frangible means (8, 9) and which is designed to be removed upon first use so as to release the closure element (4). Said device defines means (14) for storing (F) the tamper-evident tab (6; 106), once said tamper-evident tab has been separated from the first and second portions.
